

## Statement Non Diastatic

---

We hereby confirm that all strains within our yeast selection have been tested using genetic sequencing (Oxford Nanopore Technologies) for the presence of *Saccharomyces cerevisiae* var. *diastaticus*, specifically targeting the STA1 and STA2 genes and their associated regulatory regions.

Based on the sequencing results, no functional copies of these genes or their regulatory elements were detected. Therefore, we confirm that our yeast strains do not express the glucoamylase enzyme and are negative for *S. cerevisiae* var. *diastaticus*.
